The AI Infrastructure Readiness Checklist

A self-assessment for CTOs, IT Directors, and Cloud Architects.

Use this checklist to assess whether your critical systems can monitor, detect, respond, and recover on their own — before the next incident happens at 3 AM.

- [ ] **Continuous, automated monitoring**
  Infrastructure, applications, models, and workloads are observed in real time, not checked periodically.
- [ ] **AI-driven anomaly detection**
  Unusual behavior is flagged early, before it becomes a business-impacting incident.
- [ ] **Automated remediation workflows**
  Predefined responses trigger instantly, without waiting for a human to diagnose the issue.
- [ ] **Self-healing, cloud-native architecture**
  Workloads can restart, scale, or reroute themselves with minimal manual intervention.
- [ ] **End-to-end observability**
  Teams have full visibility across cloud, data, and AI layers — not isolated dashboards.
- [ ] **Documented escalation paths**
  Clear rules define when and how a human is looped in for exceptions or high-risk actions.
- [ ] **Defined governance and permissions**
  Policies, access boundaries, and approval limits are set in advance, not improvised under pressure.
- [ ] **Tested disaster recovery plan**
  Recovery procedures are rehearsed regularly, not just documented and left untested.
- [ ] **Secure-by-design cloud architecture**
  Security controls are built into the infrastructure layer, not bolted on afterward.
- [ ] **A roadmap beyond firefighting**
  IT and engineering time is shifting from reactive incident response toward innovation and growth.

Score your results

8–10 checked: AI-Ready — your infrastructure responds faster than incidents can escalate.
5–7 checked: Gaps to address — you have foundations, but key automation is missing.
Below 5 checked: Urgent action needed — most incidents still depend on a human being awake.

Ready to close the gaps?

Book a free consultation with VCloudMaster to explore secure, scalable, resilient AI-ready cloud architecture.
