AWS AI READINESS CHECKLIST

Is Your Enterprise Ready for Agentic AI?

10 Questions to Decide Where to Start — Content Generation or Workflow Automation

Companion to: Agentic AI vs Generative AI — A Solutions Brief for Technology and Business Leaders on AWS

Takes about 5 minutes

A few honest questions worth asking internally before you decide where to start — check the ones your organization can already answer “yes” to.

GENERATIVE AI READINESS (Q1–Q4)

Where could a foundation model produce this for you today?

1	Do you know which of your priority AI use cases end at an answer, versus end only when something changes in another system?	☐
2	Have you identified specific content tasks — reports, summaries, drafts — that a foundation model like Amazon Bedrock could handle today?	☐
3	Have you run a focused generative pilot before considering a broader rollout?	☐
4	Do your teams have a defined process for human review of AI-generated content before it's used?	☐

AGENTIC AI READINESS (Q5–Q10)

Where does the value only appear once an action is taken?

5	Have you identified workflows — invoice approval, shipment rerouting, reordering — where the value only appears once an action is taken?	☐
6	Can you enforce least-privilege access for every enterprise system (ERP, CRM, ITSM) an agent might call directly?	☐
7	Do you have audit logging in place to trace every autonomous action an agent takes?	☐

8	Is there a defined checkpoint where agentic actions escalate to a human before execution — not after?	☐
9	Is your governance foundation — IAM, CloudWatch, S3 logging — already built and shared across both layers?	☐
10	Do you have an internal team or implementation partner ready to close the governance and integration gap before you scale?	☐

If more than a few feel uncertain, that's not a failure — it's where most organizations are right now, and exactly where the choice between Generative AI and Agentic AI becomes clear.

SCORE YOUR CHECKLIST

Count your checked (“Yes”) boxes above, then match your total below.

Yes Count	Recommended Next Step
0–3 Yes	Start with a focused Generative AI pilot on Amazon Bedrock. Build the governance spine before adding autonomy.
4–7 Yes	Harden governance, then pilot Agentic AI in one contained, low-risk workflow.
8–10 Yes	You're ready to scale Agentic AI for operational throughput, with Generative AI running in parallel for content needs.

THE NEXT QUESTION

The enterprise AI conversation keeps evolving, one layer at a time.

Yesterday's question: “Can AI draft this for us?”
Today's question: “Can AI safely act on this for us?”
Tomorrow's question: “How much of this workflow can run without us?”

VCloudMaster partners with UAE and GCC organizations to build the AWS foundation that makes that progression possible — generative pilots, governance, and agentic execution, together, around real business goals.

Ready to find out where you stand?

Book a free 30-minute assessment with our AWS architects to score your checklist and build the right roadmap — generative first, agentic next.
